

Category:Digital audio workstations Category:Audio plugin compilers and translators Category:VST plugins Category:Virtual instrumentsA music-loving Facebook user has created a storyboard of images that she believes will one day make a person feel like they're hanging out with Taylor Swift, as well as the rest of her famous band. Mary-Kate Olsen (who is also the sister of actress Elizabeth Olsen) uploaded the storyboard to her Instagram account last week. Titled "Real Life Storyboard with Taylor Swift and her band," the slideshow features images of the band members when they were young, and ones of the quintet when they were teens. "I remember being young and listening to Taylor Swift," Mary-Kate wrote in the caption. "I always dreamed of knowing her. I always saw her in the crowd at concerts and she was my hero growing up. Now, I am actually friends with her and her band and I am so lucky to call her my friend." Mary-Kate continued to say she wished to make the photos seem like they were her personal photos. "I wanted to create something so you could see the bond these girls have," she wrote. "It is my dream that one day people will see these photos and know I was friends with Taylor Swift." While we all can't be friends with Taylor Swift, some of her "BFFs" are pretty cool people, too! They've been spending a lot of time together lately, even though the singer's rumored to be dating actor Tom Hiddleston. The band have even released a self-titled album that will be released on November 17. Although Mary-Kate hasn't been on social media much, she has been keeping busy. The Olsen twins recently hosted a Taco Bell promotion called #TwinX and were looking to win a free year of Taco Bell. The mom-turned-fashion designer also launched a fashion line with her brother, Anthony, called Anthony Marchand. And her big sister, Elizabeth, recently wrapped up her second movie role of the year playing Ingrid Bergman in the film adaptation of "Girl on the Train," which hits theaters on December 6. She also recently starred in "The Last Tycoon," and in September, she was cast in the upcoming Netflix series "Glow."Just as you are reminded, you can

In many internal combustion engines, fuel is injected into the intake manifold during the compression stroke or at the beginning of the expansion stroke to scavenge the combustion chamber. Also, in some engines, fuel is injected into the combustion chamber for other purposes including when an exhaust valve is opened to expel a previously burned mixture of fuel and air. Conventional injection systems inject a constant volume of fuel into the intake manifold or the combustion chamber. When fuel is injected into the combustion chamber, a relatively high pressure is required to overcome the resistance of the combustion chamber. However, during some engine operation, such as when a small amount of fuel is injected, relatively little pressure is required to inject the fuel. In such situations, a conventional constant volume fuel injector cannot provide adequate pressure to inject the fuel. To address this problem, a variable volume fuel injector is disclosed in U.S. Pat. No. 6,382,974. The variable volume fuel injector includes a fuel transfer chamber having a fuel transfer port and an electromagnetic coil positioned between the fuel transfer port and the fuel transfer chamber. When the fuel injector is energized, the electromagnetic coil creates a magnetic field that closes the fuel transfer port to inhibit the flow of fuel from the transfer chamber into the intake manifold. When the fuel injector is de-energized, the fuel transfer port opens and fuel from the transfer chamber is transferred into the intake manifold. The variable volume fuel injector also includes a biasing member that biases the fuel transfer port to an open position. While the variable volume fuel injector disclosed in U.S. Pat. No. 6,382,974 provides an increase in the fuel pressure, the variable volume fuel injector requires significant additional components to be added to the engine. The present disclosure is directed to overcoming one or more of the problems set forth above.  
Hyaluronic acid-hyaluronan-poly(lactic-co-glycolic acid) copolymer electrospun nanofiber dressings with cyclic peptide-based release system. The objective of this study was to develop a novel anti-inflammatory drug delivery system, namely, a hyaluronic acid (HA)-hyal 2d92ce491b
