Author: Ms.Shreya Mahesh Date: 03 January, 2019 A: As I see it, you're running into two issues. The first is that you have the CSS for the page in the HTML, but that CSS is only controlling the content on the page - it's not handling the menu structure you've set up. You need to remove the CSS and re-add it, controlling this content only, and also adding a CSS rule for the nav structure. The second issue is that the script in your header is trying to look for a script with a path of "reference-library-to-edit.js" in the directory with your HTML file. That's not the way it should be - you should instead use a relative path for that script, like "../../ref-library-to-edit.js", which will look for that file in the same directory as your HTML file. The present invention is directed to a method and apparatus for stabilizing breathing gases supplied to a patient's airways for treatment of apnea. More particularly, the present invention is directed to a system having a first stage for modifying gas flow supplied to the patient and a second stage for modifying gas flow supplied to the patient at the gas supply for treating apnea. An article entitled "Heart-lung Bypass Operation," by T. K. Schulz, et al, published in the New England Journal of Medicine, Volume 306, No. 20, July 19, 1982, discusses a procedure for heart-lung bypass operation in which oxygen-rich blood is fed to the patient by a catheter inserted into the left atrium and oxygen-poor blood is shunted from the patient's aorta through an external centrifugal pump driven by an electric motor. However, the Schulz et al. system requires the pumping of blood through a narrow tube with a high pressure head on a continuous basis and the system is not portable and the patient must be closely monitored on an intensive care unit. Another approach to treating apnea is to completely bypass the lungs and arterial blood flow is provided by a totally artificial means such as an ECMO (extracorporeal membrane oxygenation). However, ECMO systems have drawbacks and limitations. The primary drawback is the requirement for a large surface area of oxygenation in order to oxygenate the patient's blood. This requirement is not generally met by the small surface area of the patient's chest. In addition, the EC
