The D3DFast Tutorial is designed to provide a foundation of knowledge for D3D developers, and it will serve as a starting point for creating additional applications. The D3DFast Tutorial is intended for professional graphics developers who have a solid foundation in D3D programming and experience with object-oriented programming and 3D graphics development. D3DFast is the software library for Direct3D version 9. Download Now The license terms that appear below are not intended to limit the rights of the original author. Rather, they are used to protect the licensor and permit additional restrictions on derivative works. For example, if the original author has explicitly stated that a work is "Free Software", the licensee may distribute the work under terms more restrictive than those in this section. However, the original author may choose to pass around the original work under different license terms. Such passing around may make it harder for future users to track down the license terms for the original work, so users of the derivative work should be aware that this is the case and are encouraged to get in touch with the original author for clarification. In addition, some countries do not allow the distribution of software that imposes any legal restrictions at all on the users of the software, even if the software is not classified as proprietary. For example, the distribution of open source software may be legal in many countries, but in others may be illegal. Regardless of any legal implications, it is strongly recommended that any derivative work distribute the source code for the derived work, and make it clear where this code can be found. Gastric mucosal lesions were induced by the oral administration of indomethacin (ID) to rats. Rats were pretreated with lansoprazole (LPZ), lansoprazole magnesium (LMZ) or omeprazole (OPZ) for 7 days. ID was given orally for 3 consecutive days after the pretreatment of each drug. Mucosal lesions were evaluated macroscopically and histologically. ID induced severe mucosal lesions, including gastric hemorrhagic lesions in all rats. LMZ or OPZ pretreatment significantly reduced the incidence of ID-induced mucosal lesions. The order of the protective effect of LPZ, LMZ and OPZ was LMZ greater than OPZ greater than LPZ. LMZ and OPZ given for 7 days produced similar gastroprotective effects against ID, and the degree of their protection was similar to that of daily-use drugs such 2d92ce491b
