Field of the Invention The present invention relates generally to gas turbine engine combustors and more specifically to a midair swirler included in the combustor. 2. Description of Related Art A gas turbine engine combustor is an annular assembly that facilitates mixing of fuel and air in the engine, and is therefore a major component that is required to combust the fuel-air mixture and produce a hot gas stream that is pressurized, and ultimately directed, to a turbine stage. In many turbofan engines, the combustor is a separate annular assembly from the fan nozzle, and is combined with the fan cowl assembly to form a fan cowl/combustor module. The flow from the fan section of the engine is supplied to the combustor, where it is initially mixed with a primary fuel such as, for example, an unthrottled LP to fuel ratio. The fuel-air mixture is then drawn through the burner, where it is progressively enriched with additional fuel before combustion
