Data exchange AutoCAD can exchange data with third-party applications, such as AutoCAD360, AutoCAD Architect, AutoCAD Electrical and AutoCAD Civil 3D through the EXE interface or EDI (Electronic Data Interchange). It also provides XML (Extensible Markup Language) import and export functions. AutoCAD comes with a free application called AutoCAD Exchange Explorer to do this. AutoCAD Exchange Explorer and the EXE tool can work with native format files such as DXF, DWG, DGN, STP, and DFX. AutoCAD Exchange Explorer can also use the web services provided by many vendors and file formats that you import. AutoCAD does not provide its own data interchange protocol. The format can either be native or XML.

Enterprise Features In 2014, a new product called AutoCAD 360, originally called AutoCAD Architecture was launched. AutoCAD Architecture was designed to allow users to design in one application and then export as many objects as desired to the other applications. This product also included its own collaborative editing feature. AutoCAD 360 was announced to be discontinued in 2018. Multi-platform and embedded AutoCAD can run on any 32- or 64-bit platform, including Windows, macOS, Linux, and Android. A C-M-C (Cross Platform C/C++) compiler tool is included with AutoCAD. It is installed on Windows (by default), macOS, and Linux operating systems. It runs on Windows through a console, a command-line interface, or an X Windows graphical interface. The compiler can create executables that run on Mac, Linux, and Windows operating systems. If the build process fails, AutoCAD produces an error message and the build is aborted. If the build is successful, the resulting executable is in the format of a.bat or.cmd file and contains the compiler, supporting DLL files and the source code. It includes a database engine and components that work together to enable the viewing and editing of AutoCAD drawing files and the associated drawings created by AutoCAD. AutoCAD is also available on Linux and OS X through Wine or Windows virtualization. A free application, called AutoCAD Exchange Explorer was added to the AutoCAD 2010 product line to assist AutoCAD in communicating with a wide variety of file formats. (Very Advanced Manufacturing Processes) is a U.S. Department of Defense (DoD) specification and a definition that specifies key technologies, processes and practices that can be employed in order to create, manufacture, and procure complex products and components for the DoD. V.A.M.P. is one of a series of DoD requirements including FMS (Firmware Management Standard), FSS (Firmware Security Standard), BFPM (Boeing Field Program Management), and later, FPA (Firmware Product Acceptance). The FMS, FSS and BFPM requirements have been formalized by the DoD's Defense Acquisition University as the standard methods for acquiring new products and components by the DoD. V.A.M.P. (a Department of Defense requirement) is defined as the subset of these requirements that are appropriate for use in the fabrication and construction of products and components that are delivered to, and used by, the DoD. An FMS, for example, is a standard method for developing new products, whereas a V.A.M.P. is a standard practice or process for accomplishing a specific task. Thus, a V.A.M.P. may be a standard method of producing a specific product, and FMS may be a standard practice for designing, developing, producing, procuring and testing a new product. The original V.A.M.P. ("V.A.M.P.1.0") document was first published in 1998 and describes how the DoD could use advanced manufacturing processes to produce high-technology products. This document is nearly ten years old,
