=NAMEKEYMACRO for info, STARTKEYMACRO for initialization and STATUSKEYMACRO for checking/seting permissions KEYMACRO Notes: (1) Like Netware5.10 and some older MS-DOS EMMs, this one requires you to be running your DOS session with 'real-time' privileges, which is basically the equivalent to being a SYSTEM or ADMIN session. If you're not, it won't work. (2) It's a very stable and simple EMM. If you need to do a lot of manual configuration, you might want to start with this one. (3) It uses only the 5.2 MB of RAM available to the DOS session. Doing more than this might actually *run out* of RAM! (4) It can be read-only, read-write, or read-write-executable (RWX). You can change these settings in the keymacro.ini file. If you find that you're being limited by the amount of RAM available, consider using this one. (5) This is one of the few that doesn't require an 'keyboar' or a console to run. (6) It can be very fast, because the extra information stored in the EMM is not having to share space with commands like 'TASK' or 'SYSTASK'. The extra memory footprint makes it less prone to RAM problems than a standard EMM. (7) It can do some interesting things like setting-up the string of a string to be directly "executed" in a memory space that you specify. (8) You can use it to store all kinds of data and programs. If you don't understand the options available, the manual will help a lot. (9) You can have up to 3 'EMMs' in a single keymacro, allowing you to have more than one set of programs available in a single DOS session. (10) This version will not give you the option of changing the string of a string that was written to a memory area. If you need to do that, check out the 'jemmacro' version. (11) This is one of the few EMMs that has the option of enabling 'Hard Disk Defragmentation', even if your disk has fragmented files. It uses the 5.2 MB of RAM for permanent storage, and it uses 1d6a3396d6

What's New In?

Jemm is an Expanded Memory Manager for DOS, based on the source of FreeDOS EMM386. Many features in Jemm and in FreeDOS (as provided by EMM386) are disabled by default. For example, it's enabled by default the support for RAMDISK driver and for ISO9660/FAT32 file system, or it's enabled by default extended JMP and CHK instructions (which are available in Intel 8086). In order to enable all the features of Jemm it's required to install patches/fixes and/or enable patches which are hidden by default in the current version of Jemm. At the moment the following features are disabled by default: - If it's enabled, the DOS crashes when the floppy drive is enabled and after it's disabled, - The commands are executed in serial mode, - The EMM386 is no longer enabled, - All the structures are initialized after the system is loaded, - All the jump instructions are disabled, - The original DOS may be executed, - The sysset command is disabled, - The support for Microsoft's extended OEM DOS utilities, - The support for extended GEMDOS commands. Nevertheless the currently available features are really powerful. Version history ================ 1.03 - 2007.08.04 - The internal and external extension of the memory (EMM386's feature, the patch #0) has been disabled. - The support for OEMDOS utilities has been disabled. - The support for extended GEMDOS commands (all the ones which are not supported by the default version of Jemm) has been enabled. - The support for DosExtensions/DosEzw/AltosEZ/XENIX-EMM386 has been enabled. - The support for extended language has been enabled. - The support for F800-FFFF range has been enabled. - The support for Intel 80286 and newer has been enabled. - The support for a DOS with Virtual Memory has been enabled. - The support for extended 3DNow! instructions and Intel 80486 and newer has been enabled. - The support for Virtual Page Directory and Virtual Page File has been enabled. - The support for extended IOPL has been enabled. - The support for MS-DOS 6.0 and newer has been enabled. - The support for REAL.SYS has been enabled.

System Requirements:

The following is a list of minimum system requirements to be able to install and use OpenTTD. For most of these requirements I have tested the game with a machine running Windows 7 64bit, but there is an indication of what the minimum requirements for the game could be for other OS's as well. For the minimum hardware requirements you can consult the comments and the products. You can also consult this Minimum Hardware Requirements: CPU: Pentium 2 (or better) RAM: 512 MB RAM Hard Drive:
